Inspiration

We're out there with you. We value input from motorcycle enthusiasts all over the country & around the world to help us focus on developing products people want. Our Research & Development team takes these general concepts, boils them down, then blends them with unsurpassed style, innovation & quality to bring you product designs that are the best in the industry. Below is a snapshot of how we make dreams become reality.

Inspiration Küryakyn Style.

Alliana

EVOLUTION...

Above: Preliminary Sketches & Computer Models

As you browse through this wish book or examine our parts in your dealer's showroom; do you ever wonder, "How did this part get here? Or, "Where did it come from?" • Like gold or silver to a jeweler, or bronze to a sculptor, our medium is chrome. Motorcycling's precious metal is passionately manipulated into masterpieces intended to adorn the two-wheeled object of your affection & ultimately make a statement about your individuality. • Each Küryakyn product starts as someone's great idea or vision of function transformed into art. A customer visiting our tent at a rally, a call or letter from an enthusiast, visualization from a member of our design team, or

an improvement to a product recognized by one of our employees are all seeds from which our products grow. • This is when a concept is born & the metamorphosis begins. • The first two-dimensional manifestation of the form starts as a simple sketch or a drawing. A third-dimension evolves with the transformation into a hand made or C.A.D. (Computer Assisted Design) model of the part. • Different variations are created in-house using our rapid prototyping machines. These rudimentary parts are evaluated for design &

proper fit on the subject motorcycle. Since this phase allows creation of a part virtually out of thin air, changes in styling or fit are made at this time. • Once the design is finalized, & parts are tested & approved, the project is released for tooling (the process of making molds or fixtures) where the final part will be manufactured. • Initial samples of the actual parts are produced & then subject to careful scrutiny by quality control where they are inspected for flawless finish, perfect fit on the motorcycle, & road tested. The samples are then photographed, packaging is designed, & instructions are developed. Any last minute adjustments are made & finally the product is approved for production. • The final & most important step is when our product becomes part of your bike; adding to it a distinctive, personalized appearance, & giving you satisfaction, pride, & the pleasure of owning & riding a better looking motorcycle.
